

t45 box 58.48 a, 400 free chains $\times$ 50: 0 / 4 runs finished, 0 running (hollow)
 10k production sweeps per run, averages over the LAST 50% of each run; table helix_pair_db_t45_win.bin

1D theory with registries: $E_{HH} = -J + F_{HH}$, $E_{RL} = +J + F_{RL}$,
 $F_{HH} = 1.86$, $F_{RL} = 1.72$ kT (junction registry free energies)
 $\theta = 1/2$ at $J = 5.38$; $\langle |m| \rangle = 1/2$ at $J = 6.12$ for one arm of 50,
 the star of 400 INDEPENDENT arms saturates at $\langle |m| \rangle = 0.040$ (random arm signs, $\sim \sqrt{2 / \pi n_{\text{arms}}}$);
 MC points above that blue curve = chirality transfer between arms
